

1 in 7 Men Will Develop Prostate Cancer

99% of Them May Be Cured With HIFU

High intensity focused ultrasound (HIFU) is a precise, targeted, non-invasive therapy for localized prostate cancer that uses ultrasound energy to heat and destroy specifically targeted areas of tissue without damage to surrounding tissue.

- Preserves sexual and urinary function by decreasing risk of impotence from 80% to 2% and incontinence from 20% to .04% when compared to surgery, radiation and chemotherapy
- Decreases PSA levels by 95% with up to 10 years of no cancer recurrence
- Can be used as a first line of treatment for early stage prostate cancer AND a salvage therapy when other treatments fail
- No surgery, no chemo, no radiation – outpatient and non-invasive

Dr. George Suarez, board-certified urologist, is the world's leading HIFU expert with more than 15 years of experience and over 2,300 procedures performed.
